

## Elusive Clock Transition in Strontium Revealed

Researchers have measured a hard-to-observe electronic transition in strontium that was predicted six decades ago.

## **By Marric Stephens**

Pical atomic clocks rely on the existence of precisely defined, narrow-linewidth electronic transitions of atoms and ions. Currently, the most precise of these clocks uses the transition of strontium-87 from its ground state to its so-called  ${}^{3}P_{0}$  excited state (see Viewpoint: A Boost in Precision for Optical Atomic Clocks). Last year, Sebastian Blatt at the Max Planck Institute for Quantum Optics in Germany and his colleagues observed a similar transition in strontium-88. Now that same team has demonstrated coherent control of this transition, which involves strontium-88's ground and  ${}^{3}P_{2}$  excited states [1]. The researchers say that, in addition to its potential use in atomic clocks, strontium-88's  ${}^{3}P_{2}$  excited state could be used in quantum computers and quantum simulations and as a benchmark in atomic-structure calculations.

Strontium-88's ground-to- ${}^{3}P_{2}$  transition was explored for use in an optical atomic clock in the 1990s. The transition was promising because of the  ${}^{3}P_{2}$  state's long lifetime. But efforts in that direction didn't pan out. In this so-called magnetic

quadrupole transition, the transitioning electron is excited by a photon's magnetic—rather than electric—field, making the transition tricky to induce. Predictions also indicate that atoms in the  ${}^{3}P_{2}$  state are especially sensitive to environmental effects, such as external magnetic fields, and that they can transition to other states by colliding with each other inelastically.

Blatt and his colleagues overcame these problems by developing a "magic" optical lattice trap, which is state insensitive. The state insensitivity meant that the trap confined atoms in the ground and  ${}^{3}P_{2}$  states equally. It turns out that this equality of confinement leads to protection from environmental perturbation and preventing collisions.
